

AIRS Atmospheric Infrared Sounder Status

George H. Aumann
Project Scientist
30 Nov 2004

AIRS/AMSU/HSB Project Overview

Spacecraft: EOS Aqua
Instruments: AIRS, AMSU, HSB,
MODIS, CERES, AMSR-E

Launch Date: May 4, 2002
Launch Vehicle: Boeing Delta II
Intermediate ELV

Mission Life: 5 years
Team Leader: Moustafa Chahine

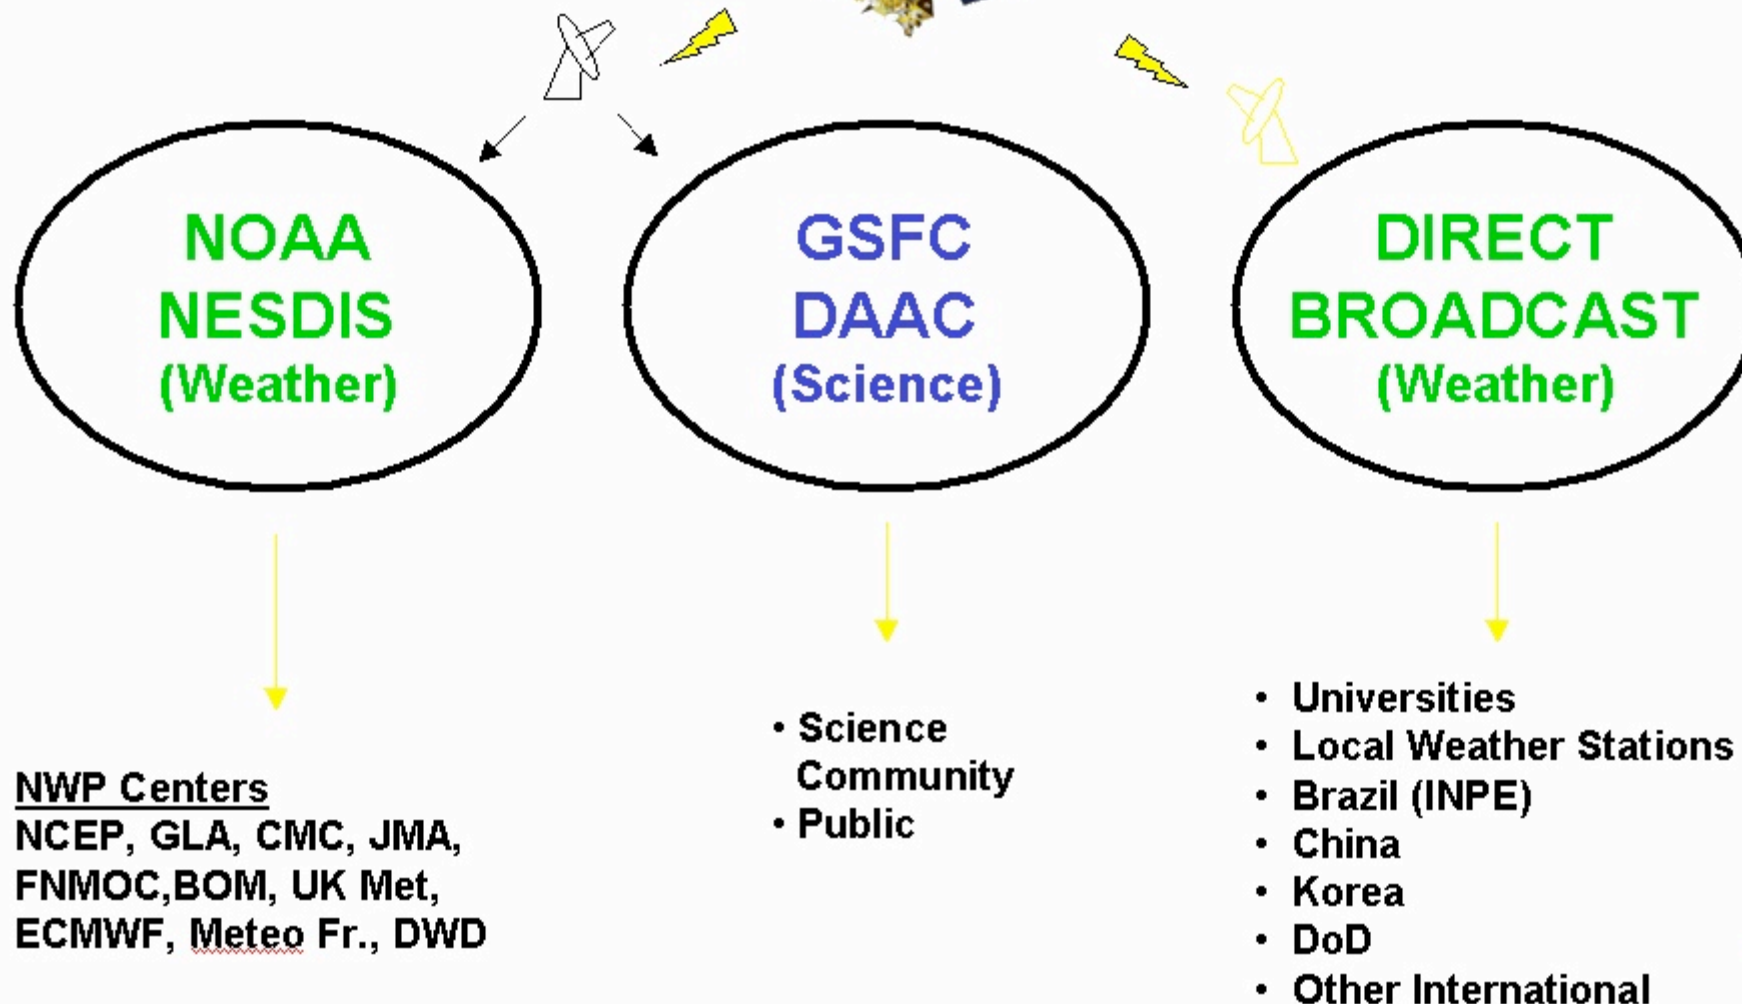

AIRS Project Objectives

1. Support Weather Forecasting
2. Climate Research
3. Atmospheric Composition and Processes

AIRS Data Distribution for Weather and Science

AIRS Data Distributed World Wide
For Weather Forecasting

AIRS/AMSU/HSB Standard Products

<u>Radiance Products (Level 1B)</u>	RMS Requirement	Current Estimate
AIRS IR Radiance	3%*	<0.2K
AIRS VIS/NIR Radiance	20%	10-15%
AMSU Radiance	0.25-1.2 K	1-2 K
HSB Radiance	1.0-1.2 K	N/A
<u>Standard Core Products (Level 2)</u>		
Cloud Cleared IR Radiance	1.0 K	<1.0 K
Sea Surface Temperature	0.5 K	1.0 K
Land Surface Temperature	1.0 K	TBD
Temperature Profile	1 K	1K
Humidity Profile	15%	15%
Total Precipitable Water	5%	5%
Fractional Cloud Cover	5%	TBD
Cloud Top Height	0.5 km	TBD
Cloud Top Temperature	1.0 K	TBD

*Absolute Relative to NIST

AIRS/AMSU/HSB Instrument Status

Research Data Products

Plans

AIRS/AMSU-A Instrument Status

- AIRS

- Excellent health
- No trends in almost all currents, temperatures, and voltages

Cooler active drive levels creeping up very slowly—at present rate of increase we should never have to de-ice

Chopper drive current, chopper drive delay, chopper phase slowly increasing

- The levels are far below alarm levels, but potential effect on M11 and M12 channel are being monitored

Both of the above trends are thought to be due to slow ice build up

Since launch, 20 channels have experienced increased noise (all but one due to radiation dosage effects)—14 of these have recovered after temperature cycling, leaving just six detectors which were good at launch but not today

- AMSU-A

- Age is starting to show
- Change in electronics since launch are gain degradations of about 17% in Channel 5 and about 5% in Channel 6 (accounted for in the two point calibration)
- Temperature sensors became noisy in Nov 04

Quality Assurance (QA) Flags are used to alert the user of out-of-spec conditions

The L1b files include all spectral radiances measured by AIRS

They have been radiometrically calibrated.

**The data have not been tuned, edited, apodized, shifted or re-registered
QA flags are set as necessary**

The L2 files include results from all all processed spectra.

If the solution does not converge at key points appropriate flags is set

When a L1b or L2 flag is raised, the user can

skip the spectrum or retrieval

evaluate if the flag is relevant to his application

Ignore the flag at his own risk

A considerable effort in the V4.0 delivery is in QA flag refinements

Three presentations this afternoon and tomorrow deal with QA.

**Illustrations of effects using granule 176 from 20020906
centered in the Atlantic ocean centered on the Azores.**

**Temperatures range from 200K
cloud tops to 300K at the surface**

20020906.176.a62e6.30N.atlantic.mat

**Gradients between adjacent footprints
are as large as 80K**

AIRS IR Absolute Radiometry better than 0.2K

**SST1231 compared to
RTG.SST**

two year mean

**day bias=-0.22K
night bias=-0.57K**

**day-night bias
observed 0.35K
MODIS 0.37K**

**day bias observed
-0.22K
expected zero**

**explanation: low cloud
contamination**

Aumann et al 2004 Denver August 2004 SPIE 5548-42

H. H. Aumann **JPL**

AIRS spectral calibration more accurate and stable than the ± 8 ppmf required for weather applications

SRF centroids determined relative to resolved upwelling spectral features

knowledge within 0.2 ppmf

stability $+0.9 \pm 0.5$ ppmf/year

The trend needs to be corrected for critical climate applications

Day/night (red/blue) variability under investigation

November 2003 protective shut down due to Solar flare

AMSU Level 1b

The AMSU is used for the initial estimate of the T(p) profile and the clear column radiance.

The AMSU calibration is complicated by sidelobe issues.

Mean bias over ocean for AMSU channels 5 through 14 using (btemp.antenna-calc.ECMWF)

The scan position dependent bias is a calibration artifact

McMillin / NESDIS

The radiances are statistically bias corrected in level 2 processing using empirical tuning.

The empirical bias correction appears to be stable

Closure is required on AMSU Level 1b

L1b product status has to upgraded to "beta validated".

RTA

The radiative transfer algorithm (RTA) converts the the signal from surfaces and layers in the atmosphere to the signal seen from space.

Evaluation of the (observed - calculated.ECMWF) indicates no scan angle dependence.

Residual frequency dependent bias at the less than 0.5K level may be due to systematic offsets in the ECMWF analysis.

Bias change as function of time at the 100mK/year level in co2 sensitive channels is due to increase in co2 column abundance of 2.2 ppmv/year

RTA

What may be good enough for weather forecasting or 1K/1km requirements is not good enough for climate quality work

EOS Aqua launch

At the level of AIRS sensitivity, the atmosphere is not as simple as the current RTA

Global change is already evident in the AIRS data after only two years.

The RTA still uses the at launch 370 ppmv co2

Level 2 Status

Cloud-clearing

$T(p)$, $q(p)$ retrievals

Error estimation

Validation

**The Level 2 Algorithm Theoretical
Basis Document needs to be updated**

Level 2 (geophysical) Product Status with examples from 20020906.176

vis3

Obtaining good retrievals in the presence of clouds is a key requirement

H. H. Aumann **JPL**

Obtaining good retrievals in the presence of clouds is a key requirement for forecast impact

Only 6% of the spectra are cloud free using the classical spatial coherence test

28% of the spectra are reasonable cloud free using the cf3 spectral filter

The cf3 spectral filter use 2388 cm⁻¹ and 2387 cm⁻¹ channel and high SNR at 250K.

Obtaining good retrievals in the presence of clouds is a key requirement for forecast impact

Only 68% of the spectra can be used after cloud-clearing

28% of the spectra are reasonable cloud free using the cf3 spectral filter

The cf3 spectral filter use 2388 cm⁻¹ and 2387 cm⁻¹ channel and high SNR at 250K.

Obtaining good retrievals in the presence of clouds is a key requirement for forecast impact

Only 68% of the spectra can be used after cloud-clearing

The cloud-clearing algorithm has difficulties in the areas of steep gradients

AIRS/AMSU/HSB

Level 2 Validation

Initially based on ECMWF comparisons

**Now switching to more accurate
ARM/CART atmospheric state definition
during EOS Aqua overpasses**

**Analysis complicated by lack of error estimates
in the level 2 products**

LAYER MEAN RMS TEMPERATURE (°C)
GLOBAL DIFFERENCES FROM "TRUTH"
September 6, 2002 50N to 50S Ocean

Mid Troposphere		Lower Troposphere		
8838	9.14%	8838	9.14%	— Tight SST criteria
20764	21.46%	20763	21.46%	— Loose SST criteria
56367	56.27%	45502	47.04%	— Troposphere good
64143	66.98%	64142	66.98%	— Stratosphere good

**1 K rms in 1km layers
in the troposphere
achieved for non-polar
ocean cases relative to
ECMWF analysis**

**Susskind November 2004
Hawaii meeting on
“Sounding of the Environment”**

**Error Estimates for the retrieval from each footprint
are key to data assimilation and level 2 product generation**

**There is little correlation between the estimated error
for each retrieval and the demonstrable error based on surface truth**

AIRS Data Assimilation

AIRS radiances have been assimilated into the operational forecast at ECMWF and UKMeto since May 2004.

Experimental radiance and L2 assimilation at NCEP/DAO

All NWC report significant positive forecast impact with AIRS data

500 MB GEOPOTENTIAL HEIGHTS

Southern Hemisphere

Level 3 Products

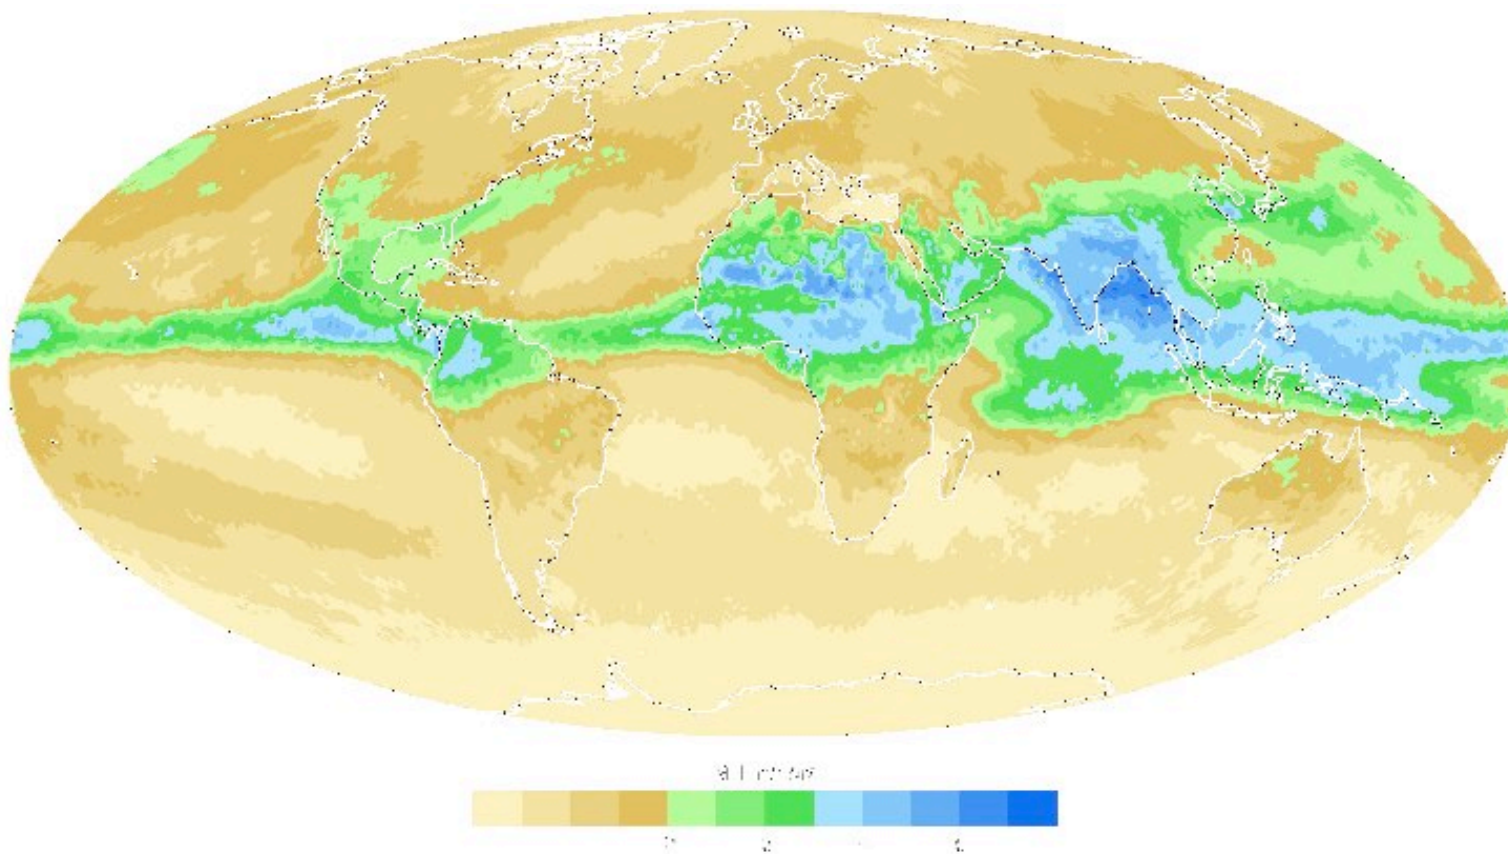

Level 2 products are mapped into daily, weekly and monthly level 3 products

This reduces the data volume by two orders of magnitude for climate research

The Level 3 products are currently only beta validated (not for research) partly due to the lack of error estimates for each retrieval

AIRS Upper Atmospheric Water Vapor (July 2003) level 3 product

10% of the water is above 600 mb
Upper tropospheric water transports moisture and latent
heat away from the tropical oceans towards the poles.

Standard Data Product Processing Status

Getting ready for V4.0 reprocessing

Level 1b

Level 2

**T(p) q(p) validated over non-polar oceans
with up to 80% clouds.**

Meets “radio sonde quality” 1K/1km requirement

Level 3 products (beta validated)

Clear ocean/land data subset

AIRS Research Products

Only 320 of the 2378 AIRS channels are used for the $T(p)$, $q(p)$ retrievals and data assimilation

The remaining channels can be used for research products

The 320 channels were picked by the AIRS team with an understanding of the instrument properties the calibration and the details of the retrieval algorithm.

Developers of research product need to be very familiar with the channel properties file and QA flags

S. S. Leroy, E. J. Fetzer and S. L. Granger (2004) “The interaction of Atmospheric Kelvin Waves with Humidity and Convection as Observed in AIRS Data. Submitted to Journal of Geophysical Research.

The **47 \pm 9 mK/year trend** in the difference between bt2229.- bt2388 is explained by a 2.2 ppmv/year co₂ and 0.6 ppmb/year n₂o increase

Aumann et al 2004 (Submitted to GRL)

H. H. Aumann **JPL**

AIRS Product Upgrade Plans

Updated ATBD for level 1b and Level 2

Validation of level 2 products over land and polar

Global emissivity maps to facilitate data assimilation over land

Cloud-clearing for single footprints for better horizontal resolution

Global co₂ and ch₄ maps

Measure five year trend in mid tropospheric temperatures and water

Use AIRS data for intermediate range (El Nino) forecasting

Improve AIRS data utilization by science community

Summary

With more than two years of data the stability and accuracy of the AIRS calibration is established at a climate quality level and sets the standard for future hyper-spectral sounders

AIRS data are used operationally in the forecast with positive impact

Level 2 products have validated 1K/1km accuracy over non-polar ocean with about 50% yield from the bottom to the top of the atmosphere

Publications of research products are emerging

The first climate trends are showing up in the AIRS data
